

ESRI DEVELOPER SUMMIT 2023

ArcGIS Enterprise: Publish Your Own Routing Services

Deelesh Mandloi

Max Zeng

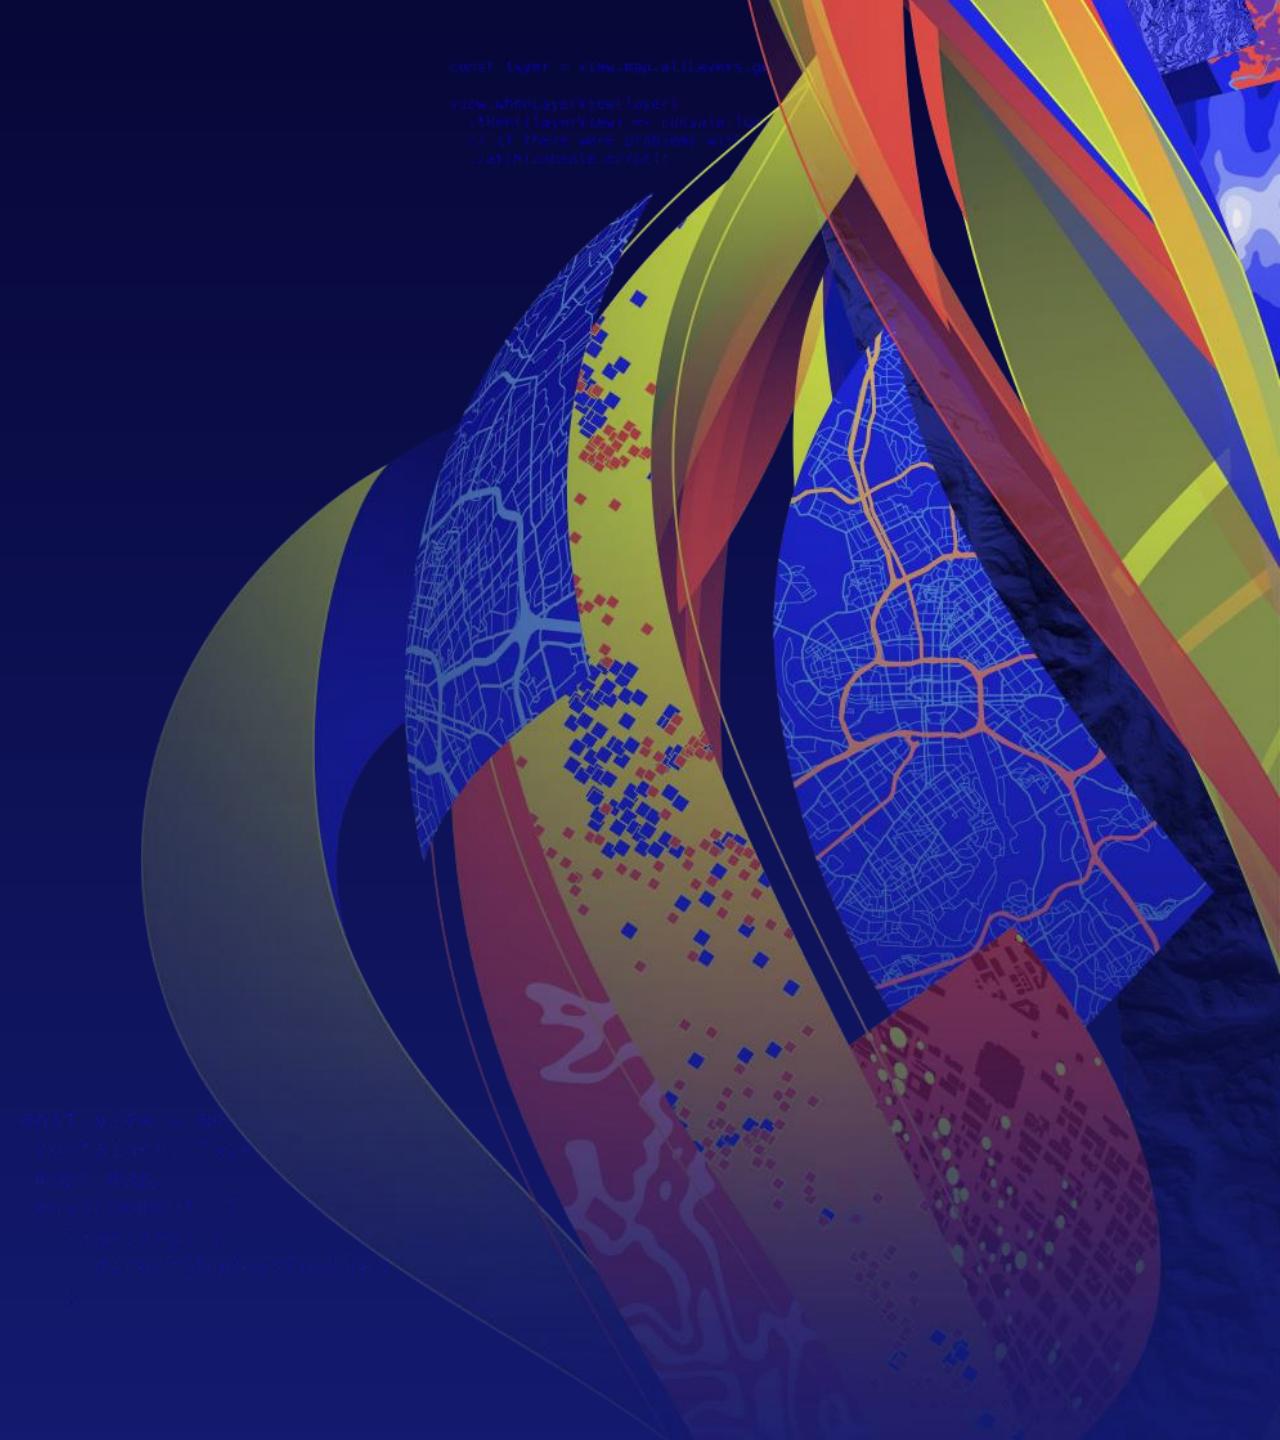

Slides and code samples for this workshop on Publishing Your Own Routing Services

- <http://esriurl.com/ds23rs>
- <https://github.com/EsriDevEvents/arcgis-enterprise-publish-your-own-routing-services-2023>

Agenda

- Routing concepts
- ArcGIS Enterprise publishing workflow
- Standard routing services
- Custom routing services

Routing Concepts

```
const view = new  
  ol.View({  
  center: [0, 0],  
  zoom: 10,  
  rotation: 0  
});  
  
const layer = view.map.getLayers().get(0);  
  
view.whenLayerView(layer)  
.then(layerView => console.log(  
  // If there were problems with  
  // catching errors:  
  layerView.getFeatures().catch(error =>  
    console.error(error))  
)
```

```
const layer = view.map.getLayers().get(0);  
  
view.whenLayerView(layer)  
.then(layerView => console.log(  
  // If there were problems with  
  // catching errors:  
  layerView.getFeatures().catch(error =>  
    console.error(error))  
)
```

Origin-Destination Cost Matrix

Origin-Destination Cost Matrix

Analysis is performed on a network dataset

Where do I get a network dataset?

- Purchase StreetMap Premium for ArcGIS

- High quality ready-to-use network dataset
 - Can add your own street data

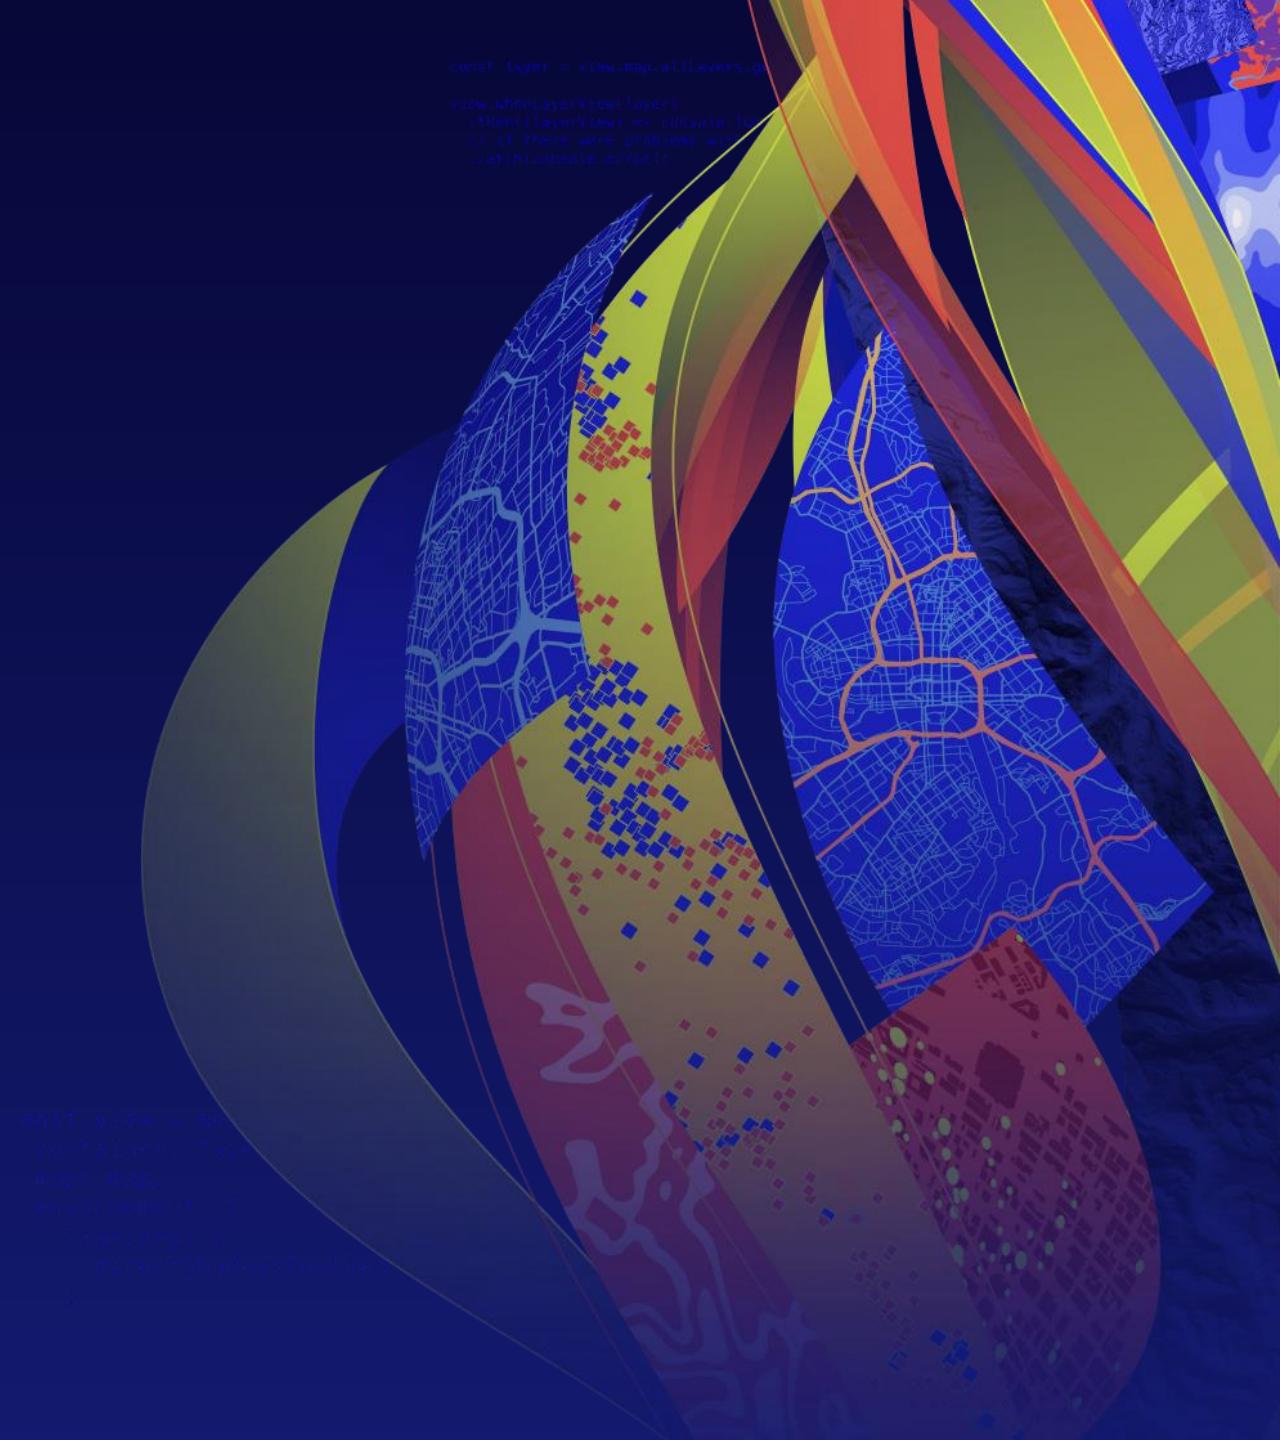

- Build your own

- Your organization's data
 - Try the ArcGIS Pro Tasks to Create a Local Government Network Dataset
 - TIGER
 - OpenStreetMap

- Use the ArcGIS Online routing services

- You don't need a network. You just call the services.

ArcGIS Enterprise

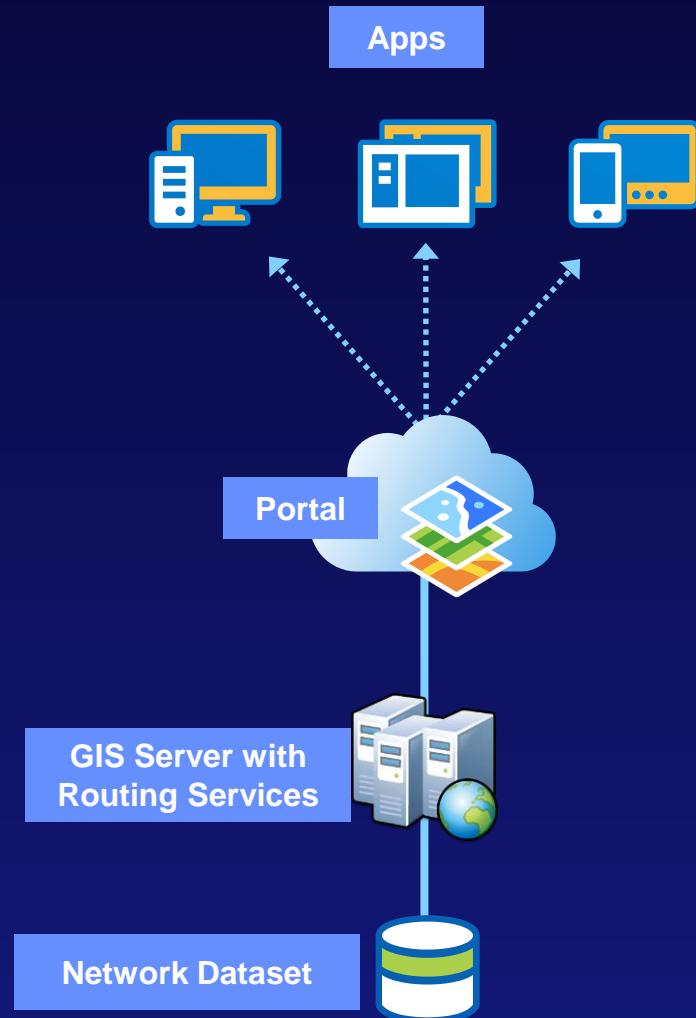

```
const layer = view.map.allLayers.get(0);
view.whenLayerView(layer)
  .then(layerView => console.log(
    // If there were problems with the layer
    // catch(console.error));
  ));
```

```
const view = new MapView({
  container: "map",
  map: {
    basemap: "topo",
    center: [-122.33, 37.77],
    zoom: 13
  },
  ui: {
    components: [
      "scale",
      "zoom"
    ]
  }
});
```

What is ArcGIS Enterprise?

- Enables “Web GIS” in your infrastructure
 - On-premises or in your own cloud
- Formerly known as ArcGIS for Server

What are GIS services?

- **GIS service** → GIS resource running on a server
 - vs. GIS application on your local computer

- Share GIS resources to the web as following service types

Map

Feature

Network Analysis

Geodata

Geoprocessing

Image

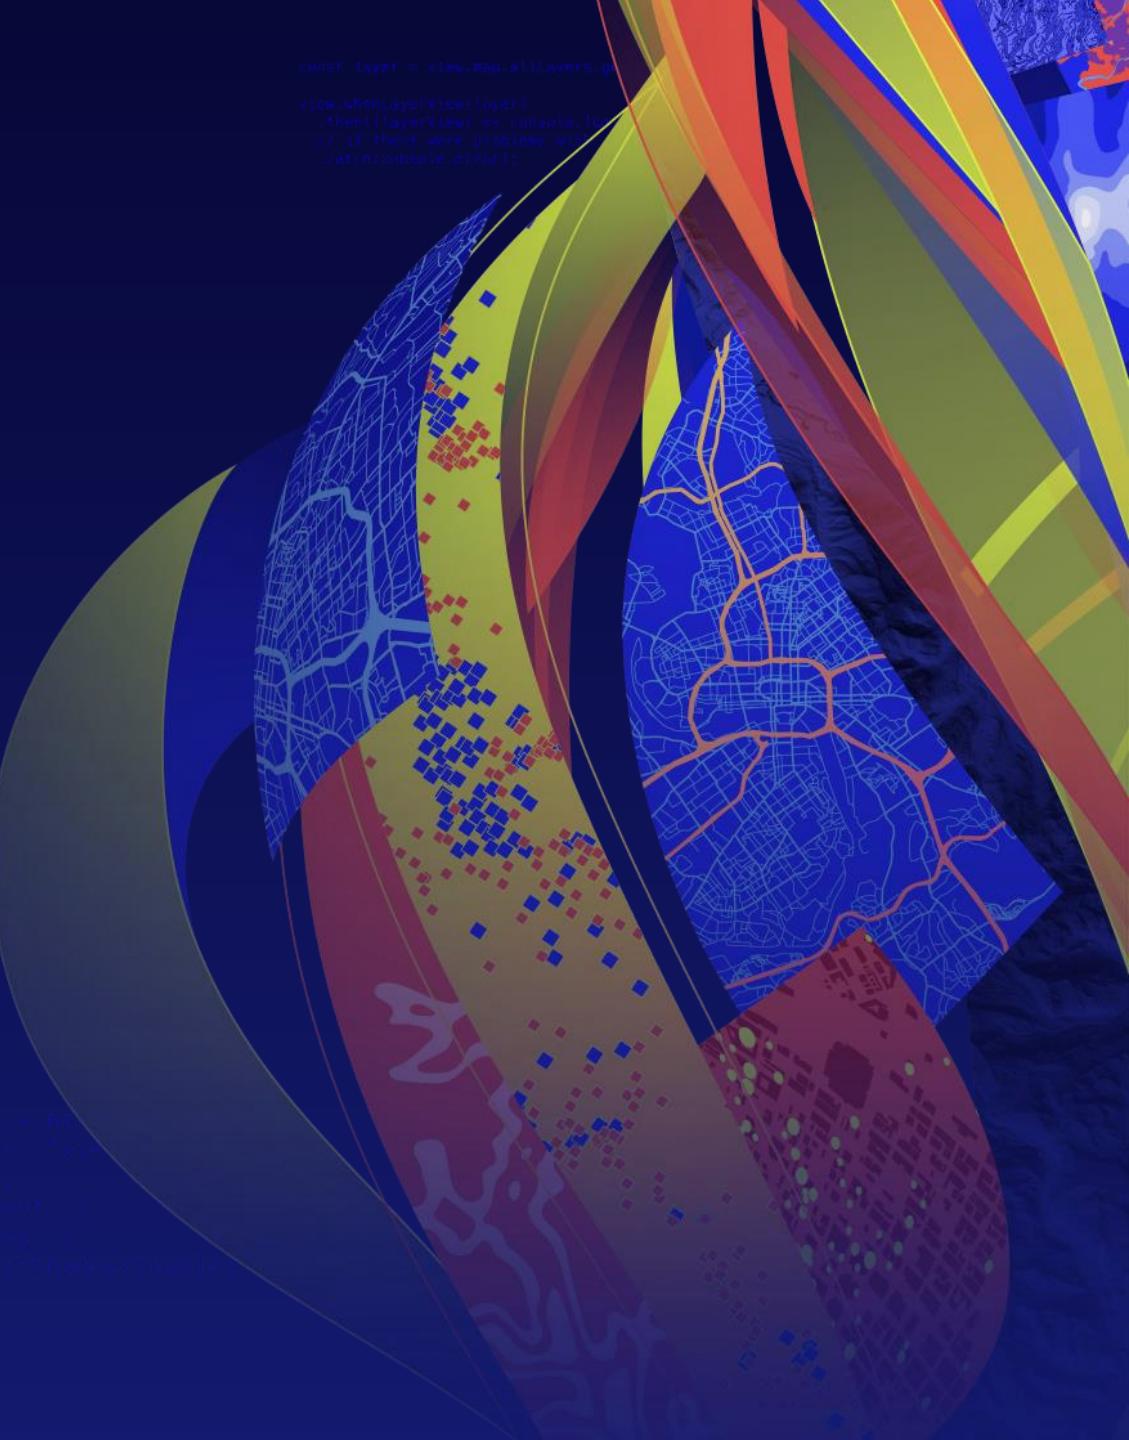

Locator

Schemas

Routing Services

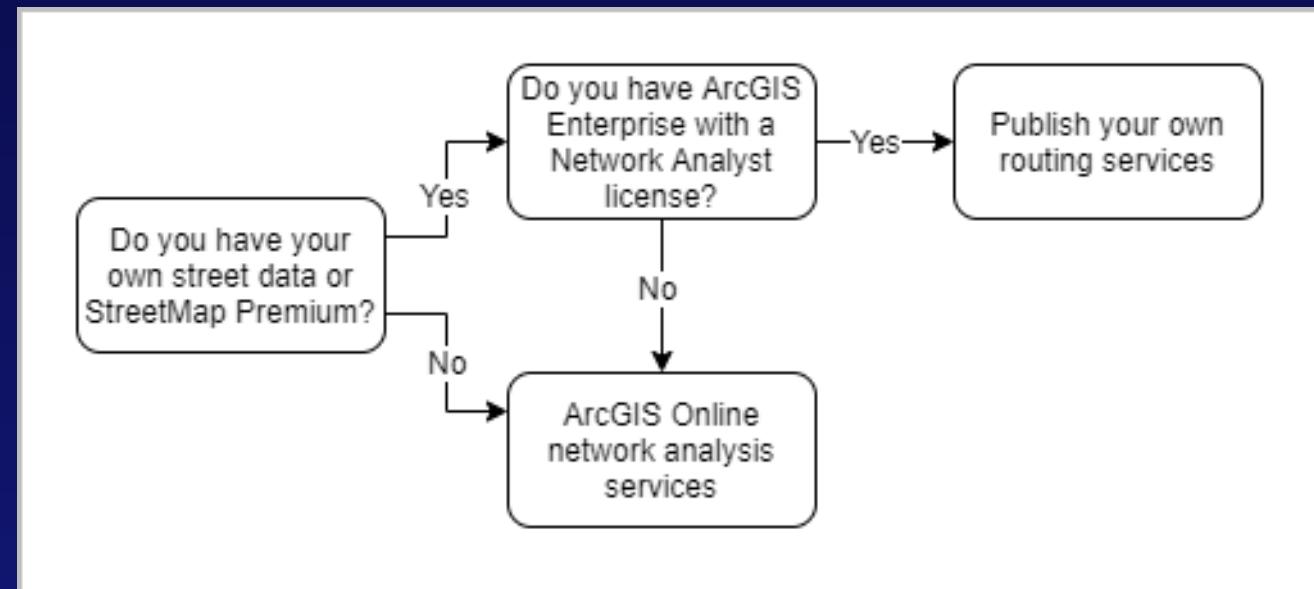

```
const view = new  
  ol.View({  
    center: [0, 0],  
    zoom: 10  
});  
  
map.addLayer(  
  new ol.layer.Tile({  
    source: new ol.source.OSM()  
});
```

```
const layer = view.map.getLayers().get(0);  
  
view.whenLayerView(layer)  
.then(layerView => console.log(  
  // If there were problems with  
  // catching errors:  
  layerView.getFeatures().catch(console.error);
```

ArcGIS Online or ArcGIS Enterprise

- When should I use ArcGIS Online routing services or publish my own routing services ?

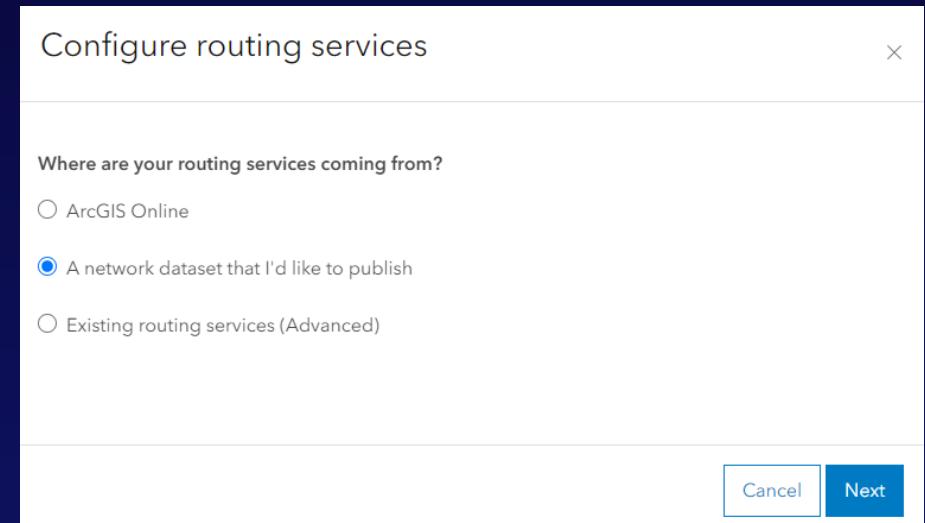

Standard and custom routing services

- **Standard routing services** are the map and geoprocessing services using out-of-the-box capabilities provided by Network Analyst.
 - Provides full integration with Esri provided client apps such as ArcGIS Pro and Map Viewer.
- **Custom routing services** are the geoprocessing services with custom capabilities that you develop using `arcpy.nax` Python module.

Publish standard routing services

- Configure routing services from the ArcGIS Enterprise portal website
 - New at ArcGIS Enterprise 11.0
 - Not available with a standalone ArcGIS Server
- Publish routing services utility tool
 - Command line tool that works with standalone or federated ArcGIS Server

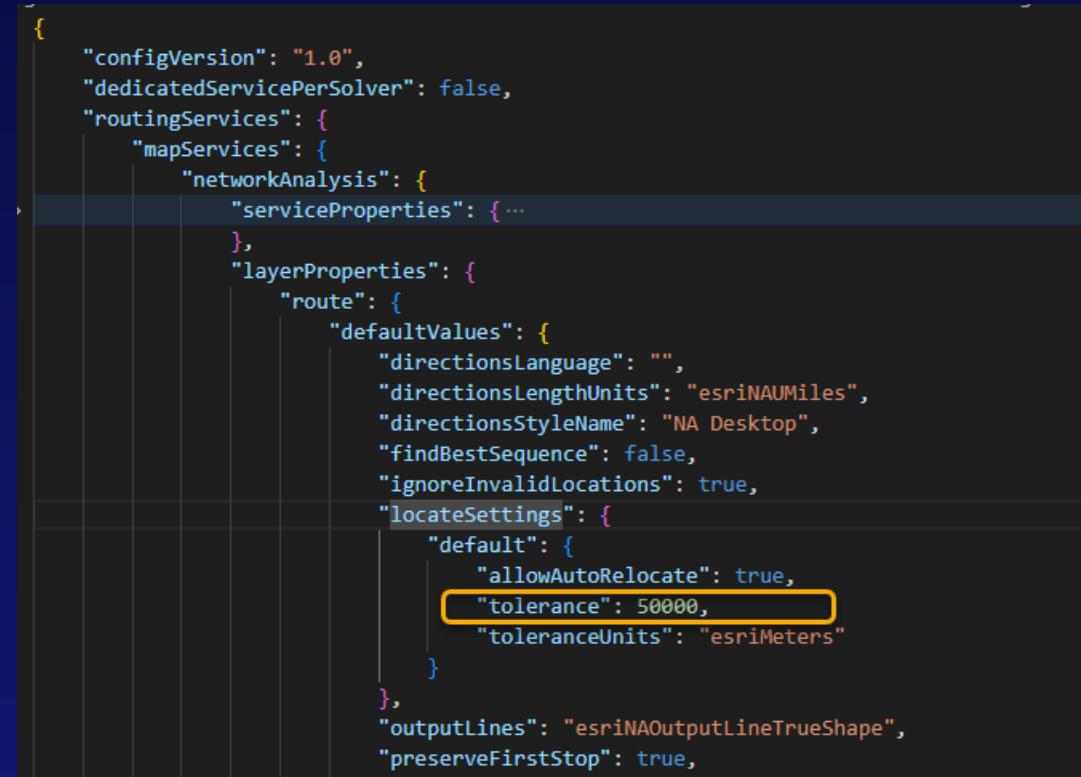

The screenshot shows a "Select Command Prompt" window with the following command entered:

```
C:\>"C:\Program Files\ArcGIS\Server\tools\PublishRoutingServices\publishroutingservices.bat"  
-s gisserver.domain.com -P gisportal.domain.com -u admin -p site.admin -o D:\RoutingServices\  
ServiceDefinitions -n D:\data\Streets.gdb\Routing\Routing_ND
```

Publish standard routing services

- Specify additional properties for routing services using a configuration file.
- Configuration file can be specified when using the website or the CLI tool.

```
{  
    "configVersion": "1.0",  
    "dedicatedServicePerSolver": false,  
    "routingServices": {  
        "mapServices": {  
            "networkAnalysis": {  
                "serviceProperties": {...}  
            },  
            "layerProperties": {  
                "route": {  
                    "defaultValue": {  
                        "directionsLanguage": "",  
                        "directionsLengthUnits": "esriNAUMiles",  
                        "directionsStyleName": "NA Desktop",  
                        "findBestSequence": false,  
                        "ignoreInvalidLocations": true,  
                        "locateSettings": {  
                            "default": {  
                                "allowAutoRelocate": true,  
                                "tolerance": 50000,  
                                "toleranceUnits": "esriMeters"  
                            }  
                        }  
                    },  
                    "outputLines": "esriNAOutputLineTrueShape",  
                    "preserveFirstStop": true,  
                    "routeType": "esriNARouteTypeShortest",  
                    "useCache": true  
                }  
            }  
        }  
    }  
}
```

Updating standard routing services

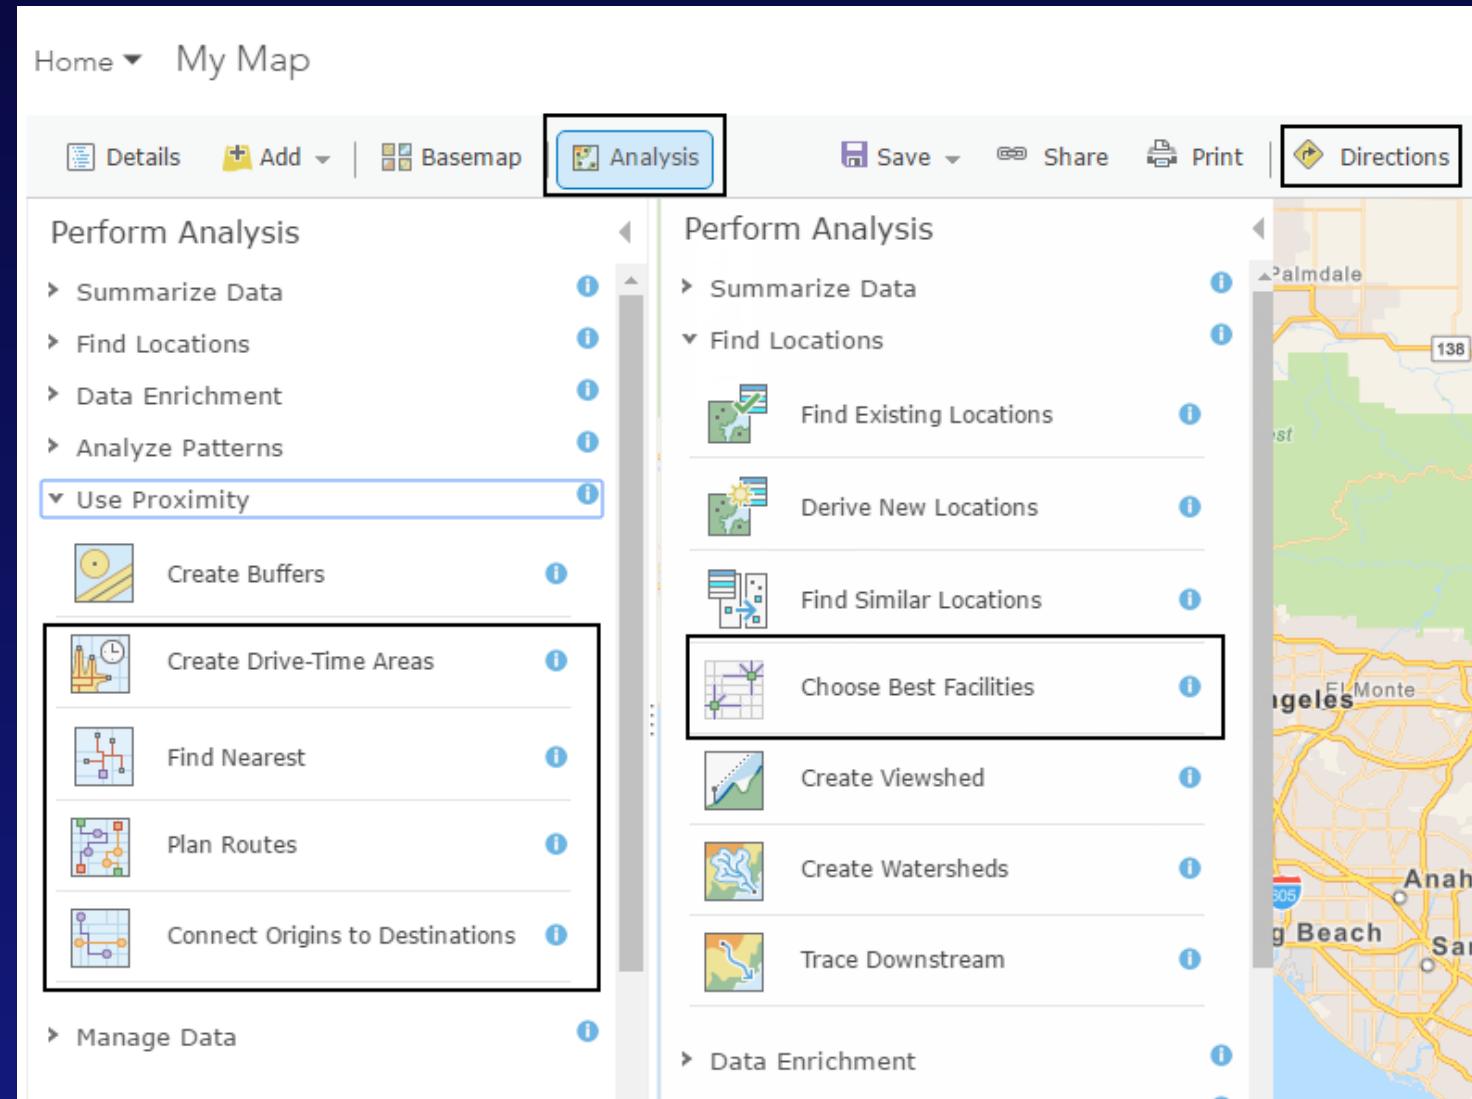

- Manually delete existing standard routing services then recreate new ones
 - Upgrading to newer versions of ArcGIS Enterprise
 - Upgrading street data (for example, using newer version of StreetMap Premium)

Using standard routing services in Map Viewer

- Directions button

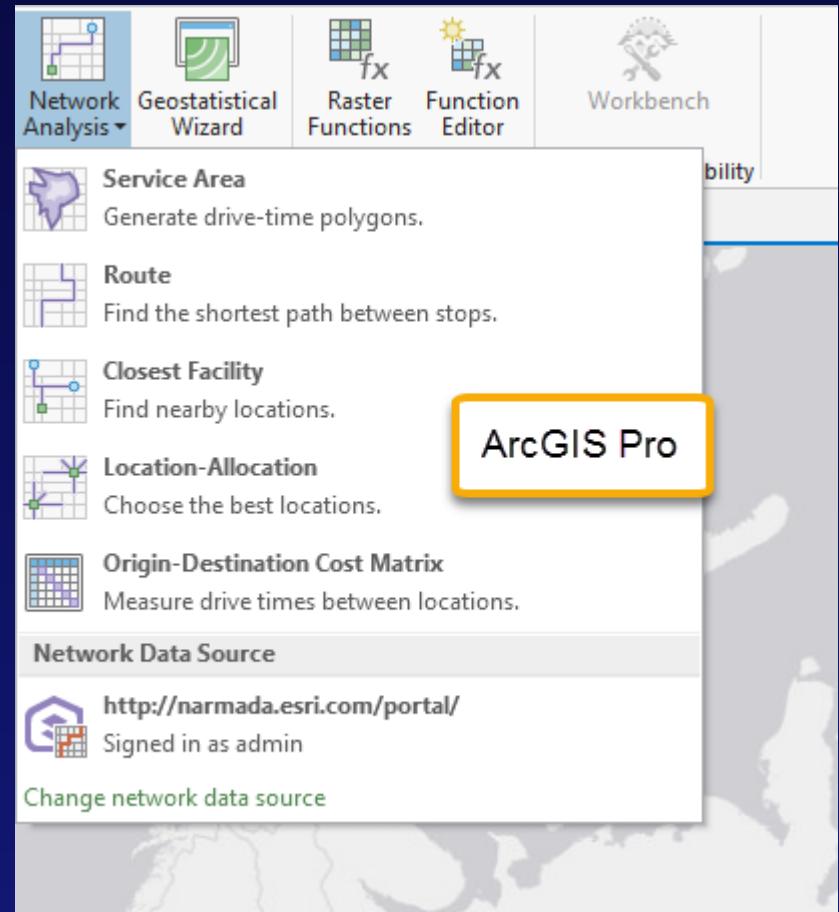

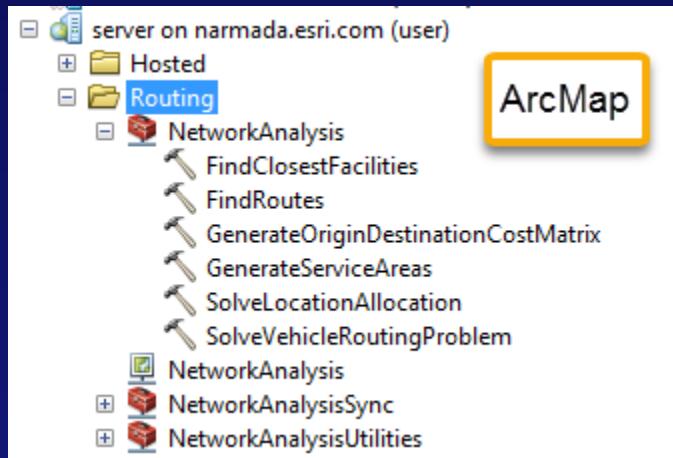

- Analysis tools

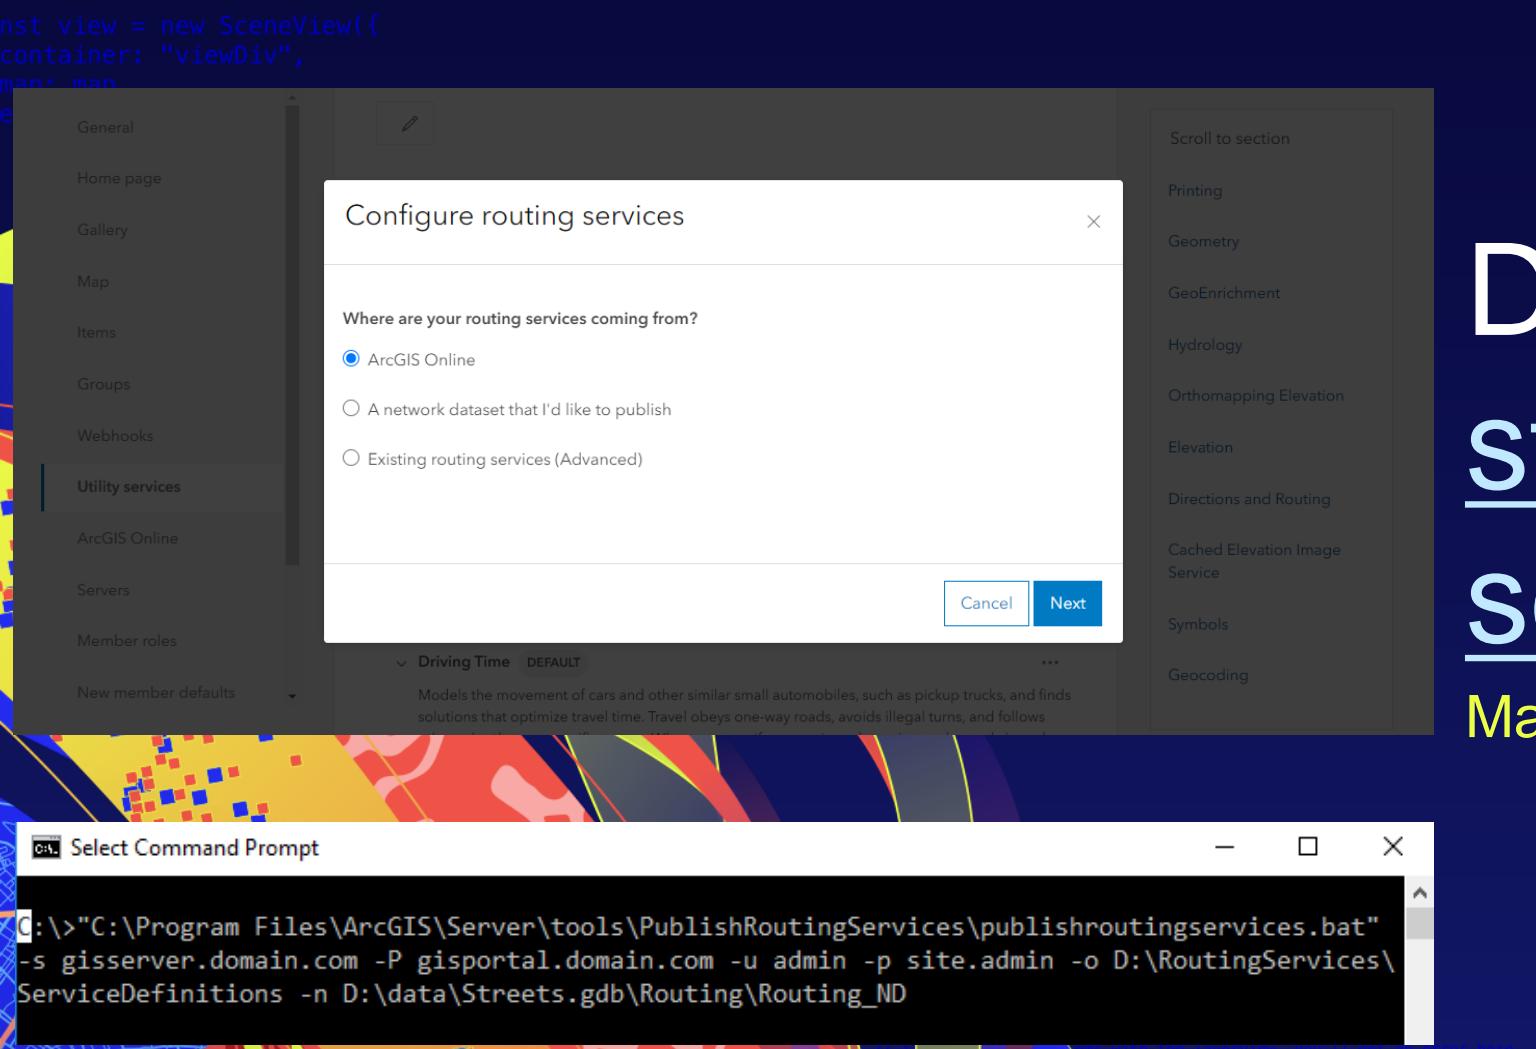

- Most tools in the Use Proximity toolset
- Choose Best Facilities tool in Find Locations toolset
- Summarize Nearby tool in Summarize Data toolset

Using standard routing services in ArcGIS Desktop

- Use from Network Analysis gallery in the Analysis tab within ArcGIS Pro
- Use from an ArcGIS Server connection in ArcMap

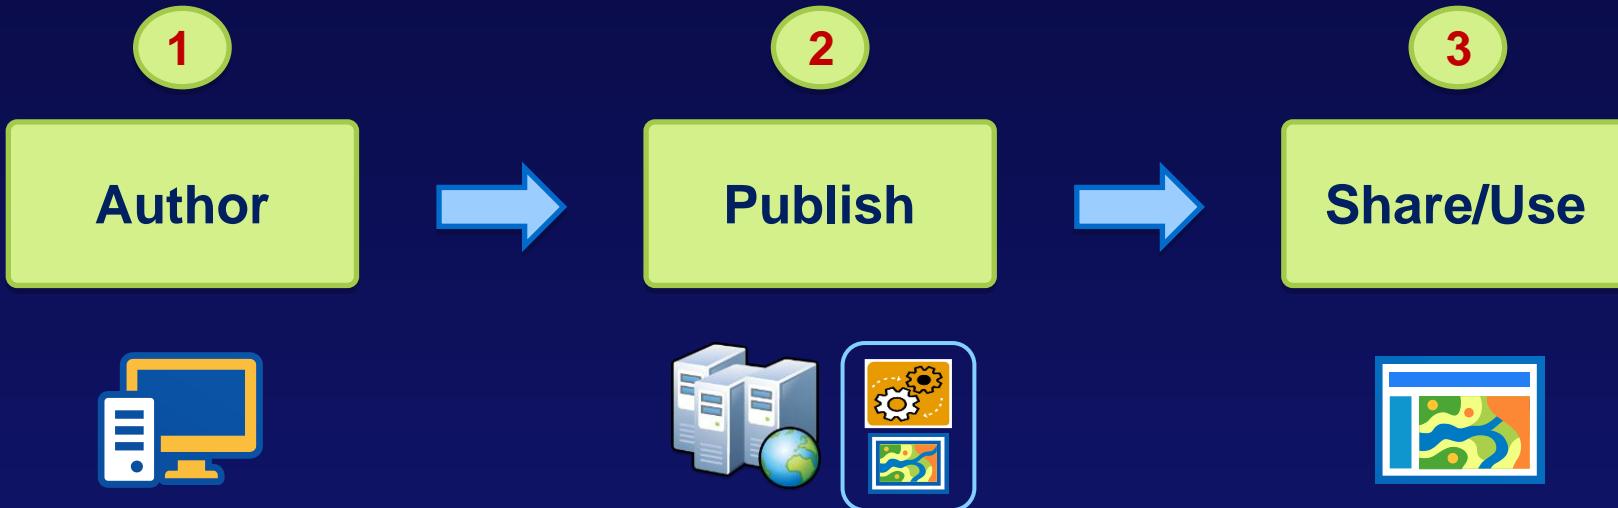

Demo: Publish standard routing services

Max Zeng

Custom routing services

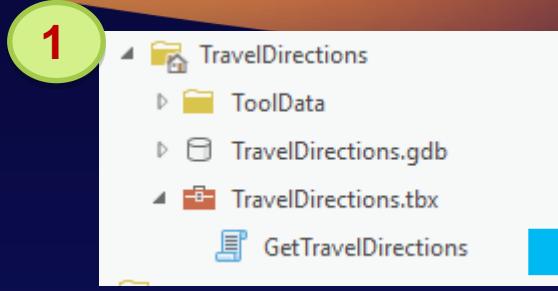

- Geoprocessing service (or web tool) with custom capabilities
- Publish a custom routing service
 - If you need the service to perform additional analysis along with network analysis. For example, find a route and calculate an elevation profile for the route
 - Combine multiple network analyses in a single service. For example, determine accessible open houses and then find the best route to visit them
- Author a geoprocessing script tool using arcpy and arcpy.nax Python modules

Publishing workflow for geoprocessing services

Geoprocessing service

1 Author using geoprocessing script tool based on arcpy and arcpy.nax Python modules

Script tool

```
/* Generate travel directions based on a thread safe */
/* array */

def getDirections():
    """Generate travel directions based on a thread mode."""
    # Add code here
    pass

# Create a thread safe array
# Note: This array needs to be created before any arcpy.da operations
# as certain context of the arcpy.da environment is lost once arcpy.da is used.
# A better context of the arcpy.da environment is provided by the arcpy.da environment
# which context of the arcpy.da environment is lost once arcpy.da is used.
# Note: arcpy.da environment is not thread safe.
# Note: arcpy.da environment is not thread safe.

# Initialize route solver and set analysis settings
route_solver = arcpy.nax.RouteSolver()
route_solver.routeNetwork = "TravelDirections"
route_solver.routeNetworkType = "One Way"
route_solver.routeNetworkConnections = "True"
route_solver.routeNetworkRestrictions = "True"

# Load shapefile
# Note: This shapefile does not have an envelope or bounding box.
# Note: It is better to use arcpy.da environment when using
# arcpy.da environment because it is not thread safe.
# Note: arcpy.da environment is not thread safe.

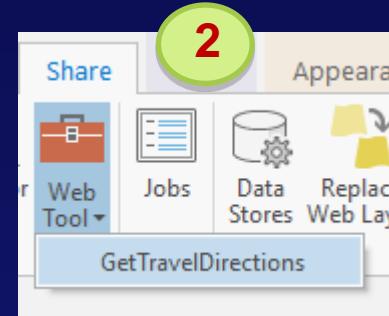

# Set route settings and error messages in case the solve is not successful.
# Note: arcpy.da environment is not thread safe.
route_solver.routeMode = "Driving"
route_solver.routePriority = "Shortest"
route_solver.routeStartLocation = "Start"
route_solver.routeEndLocation = "End"
route_solver.routeMaxLocations = 10
route_solver.routeMinLocations = 1
route_solver.routeOrder = "Left To Right"
route_solver.routeReturnDirections = "True"

# Solve the route
result = arcpy.nax.RouteSolve(result, route_solver)

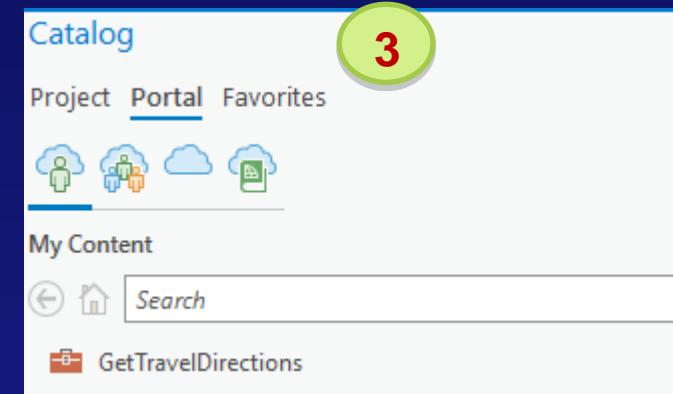

# Export the directions
result.exportToHTML(result.RouteName, result.Directions)
getDirections()
```

Python code

2 Run the tool and publish the result as a web tool

3 Use from Map Viewer, ArcGIS Pro, ArcMap, or programmatically using ArcGIS APIs or SDKs

Network Analysis Workflow with arcpy.nax Python Module

1. Initialize the analysis object (based on a specific network data source)
2. Set the properties for the analysis
3. Load the inputs
4. Solve the analysis
5. Work with the results

Common to all the network analyses

arcpy.nax Analysis (Solver) Classes

Properties

OriginDestinationCostMatrix

accumulateAttributeNames
allowSaveLayerFile
defaultDestinationCount
defaultImpedanceCutoff
distanceUnits
ignoreInvalidLocations
lineShapeType
networkDataSource
overrides
searchQuery
searchTolerance
searchToleranceUnits
timeOfDay
timeUnits
timeZone
travelMode

Methods

count()
fieldMappings()
fieldNames()
insertCursor()
load()
solve()

- Easy-to-use python objects for network analysis
- Analysis class for each solver
 - Set properties
 - Load inputs
 - Solve
- Analysis class for solve results
 - Access outputs

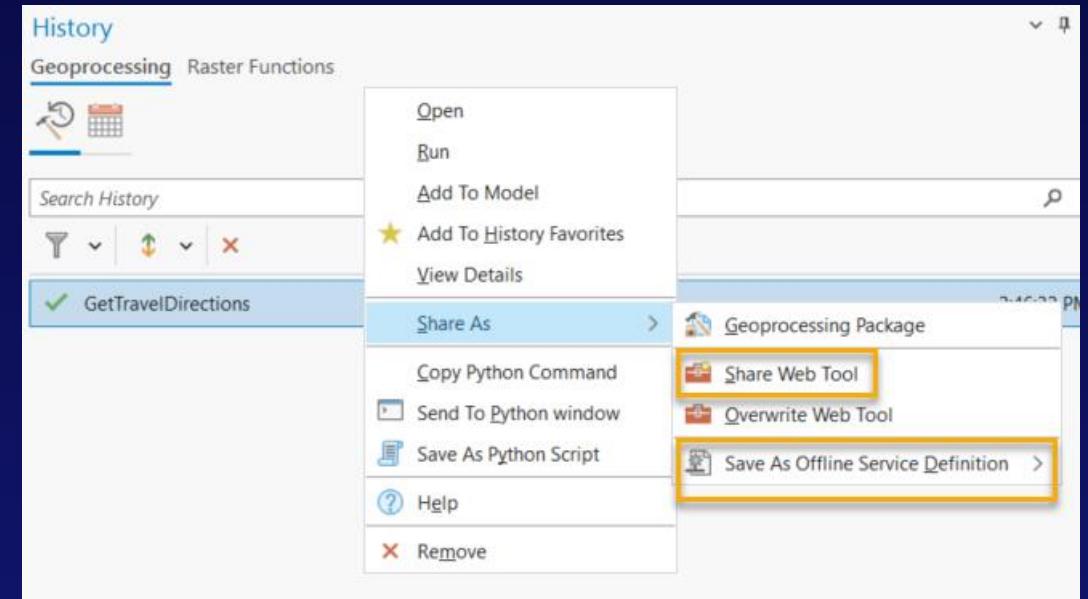

OriginDestinationCostMatrixResult

isPartialSolution
solveSucceeded

count()
export()
fieldNames()
saveAsLayerFile()
searchCursor()
solverMessages()

Publish geoprocessing script tool as geoprocessing service

- Share as Web tool from ArcGIS Pro
- Save as offline service definition
 - Useful when implementing dev, staging, and production workflow
- Using a Python script

GeoprocessingSharingDraft >> StageService >> UploadServiceDefinition

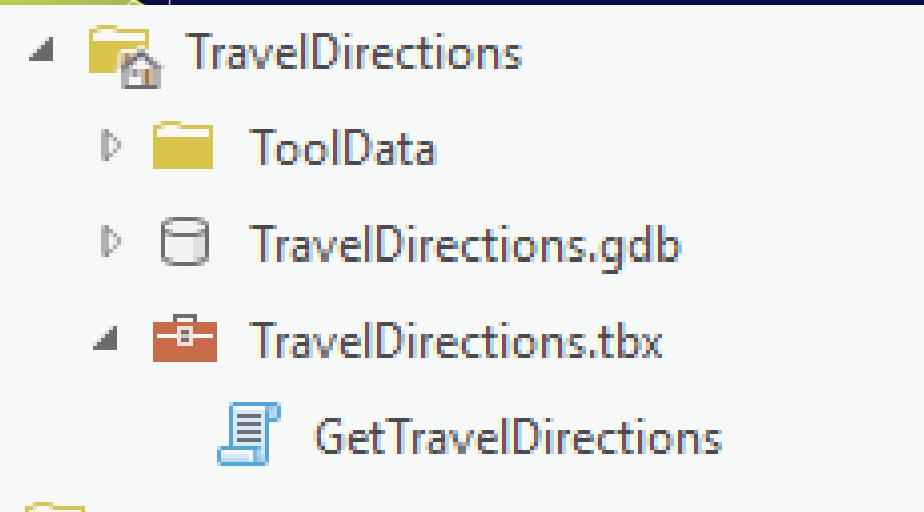

Tips and tricks when authoring geoprocessing services

- Use a network dataset layer instead of a network dataset catalog path
 - Significant performance improvement as the connection to the network dataset is established once during the startup of the service
- Write a geoprocessing script tool using arcpy.nax Python module
 - Faster execution times as compared to services created from geoprocessing model tool
 - Use Feature Set data type for inputs
 - Write outputs to memory-based workspace instead of a file geodatabase
 - Avoid writing too many messages from your script tool
- Use network datasets in mobile geodatabases instead of file geodatabases

Tips and tricks when publishing geoprocessing services

- Set Input mode for network dataset as constant
 - Hides the network dataset from service consumers
- Register the folder containing the network dataset as a data store instead of copying data
 - You control the location of the data and allows for easier data updates
- Do not store the network dataset on a file share
 - If the ArcGIS Site has multiple machines, manually copy the network dataset to a local storage on all the machines
- Reusejobdir

```
const view = new SceneView({  
  container: "viewDiv",  
  map: map,  
  environment: {  
    lighting: {  
      directShadowsEnabled: true  
    }  
  }  
})
```

Demo: Create a geoprocessing service

Max Zeng

Road ahead

- ArcGIS Enterprise 11.2 will provide new Python API as part of `arcpy.nax` module to
 - Extend network datasets using custom evaluators
 - Customize directions
- Publish custom routing services that use the new API to replace any existing server object extensions (SOE) for routing

In Summary

- Publish standard routing services
 - Configure routing services from ArcGIS Enterprise portal website
 - Publish routing services utility
- Custom routing services
 - Author geoprocessing script tools using arcpy and arcpy.nax module
 - Publish geoprocessing script tools as geoprocessing services
